

## 3b. Feature Matching

The feature matching takes the reference data and attempts to identify corresponding features in the OSM data set. Feature matching is a necessary precondition to compare single features rather than feature characteristics on study area a grid cell level, as well as for merging two data sets.

### Method

Matching features in two road data sets with each their way of digitizing features and a potential one-to-many relationship between edges (for example in the case where one data set only maps road center lines, while the other map the geometries of each bike lane) is not a trivial task.

The method used here converts all network edges to smaller segments of a uniform length before looking for a potential match between the reference and the OSM data. The matching is done on the basis of the buffered distance between objects, the angle, and the undirected Hausdorff distance, and is based on the works of [Koukoletsos et al. \(2012\)](#) and [Will \(2014\)](#).

Based on the matching results, the following values are computed:

- The number and length of matched and unmatched edges, in total and per grid cell
- A comparison of the attributes of the matched edges: Is their classification of cycling infrastructure as protected or unprotected the same?

### Interpretation

It is important to visually explore the feature matching results, since the success rate of the matching influences how the analysis of number of matches should be interpreted.

If the features in the two data sets have been digitized differently - e.g. if one data set has digitized bike tracks as mostly straight lines, while the other includes more winding tracks, the matching will fail. This is also the case if they are placed too far from each other. If it can be confirmed visually that the same features do exist in both data sets, a lack of matches indicates that the geometries in the two data sets are too different. If however it can be confirmed that most real corresponding features have been identified, a lack of matches in an area indicates errors of commission or omission.

## Match features

### Run and plot feature matching

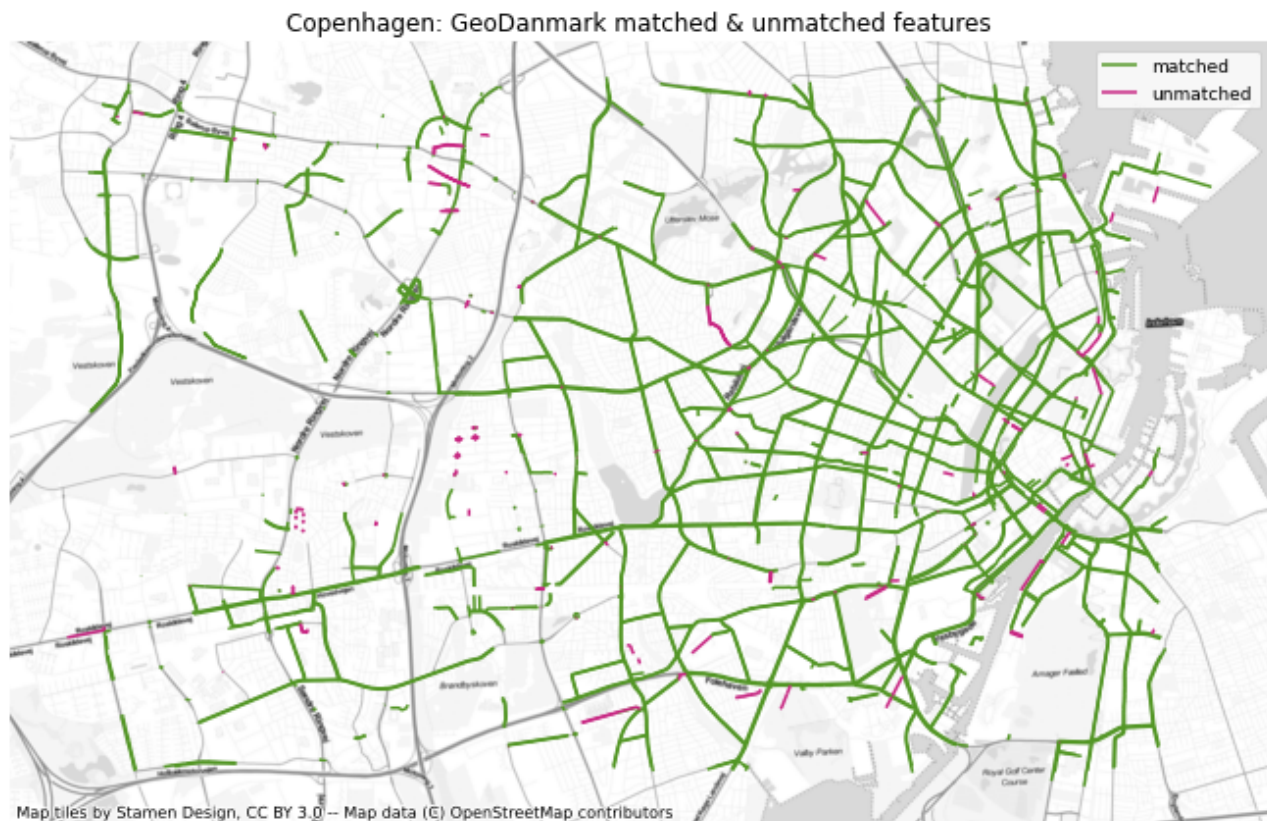

Segments created successfully!

Segment matching has already been performed. Loading existing segment matches, matched with a buffer distance of 15 meters, a Hausdorff distance of 17 meters, and a max angle of 30 degrees.

Interactive map saved at [results/COMPARE/cph\\_geodk/maps\\_interactive/segment\\_matches\\_15\\_17\\_30\\_compare.html](https://results/COMPARE/cph_geodk/maps_interactive/segment_matches_15_17_30_compare.html)

### Matched and unmatched features

### Feature matching summary

Edge count: 2588 of 5671 OSM edges (45.64%) were matched with a reference edge.

Edge count: 4313 out of 4705 reference edges (91.67%) were matched with an OSM edge.

Length: 422.50 km out of 814.18 km of OSM edges (51.89%) were matched with a reference edge.

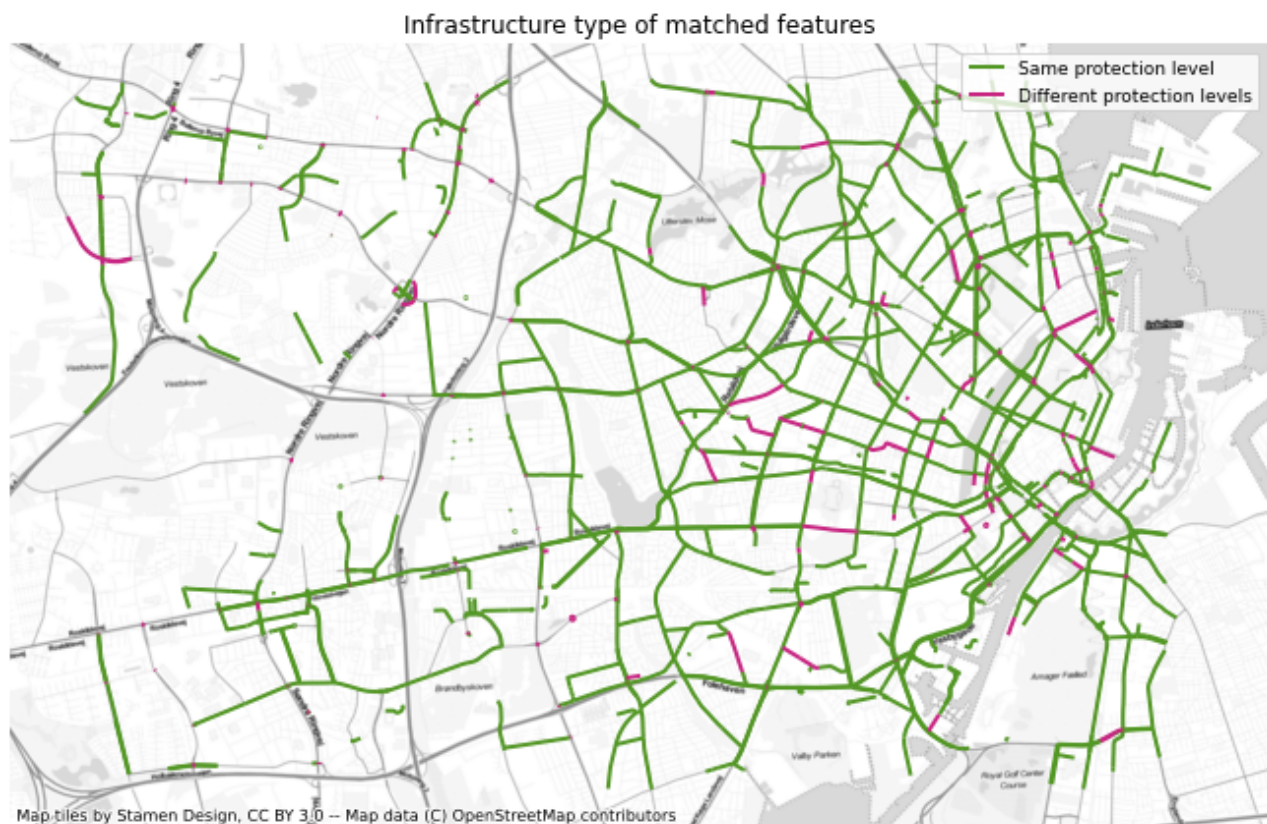

Length: 603.15 km out of 626.48 km of reference edges (96.28%) were matched with an OSM edge.

## Analyze feature matching results

### Matched features by infrastructure type

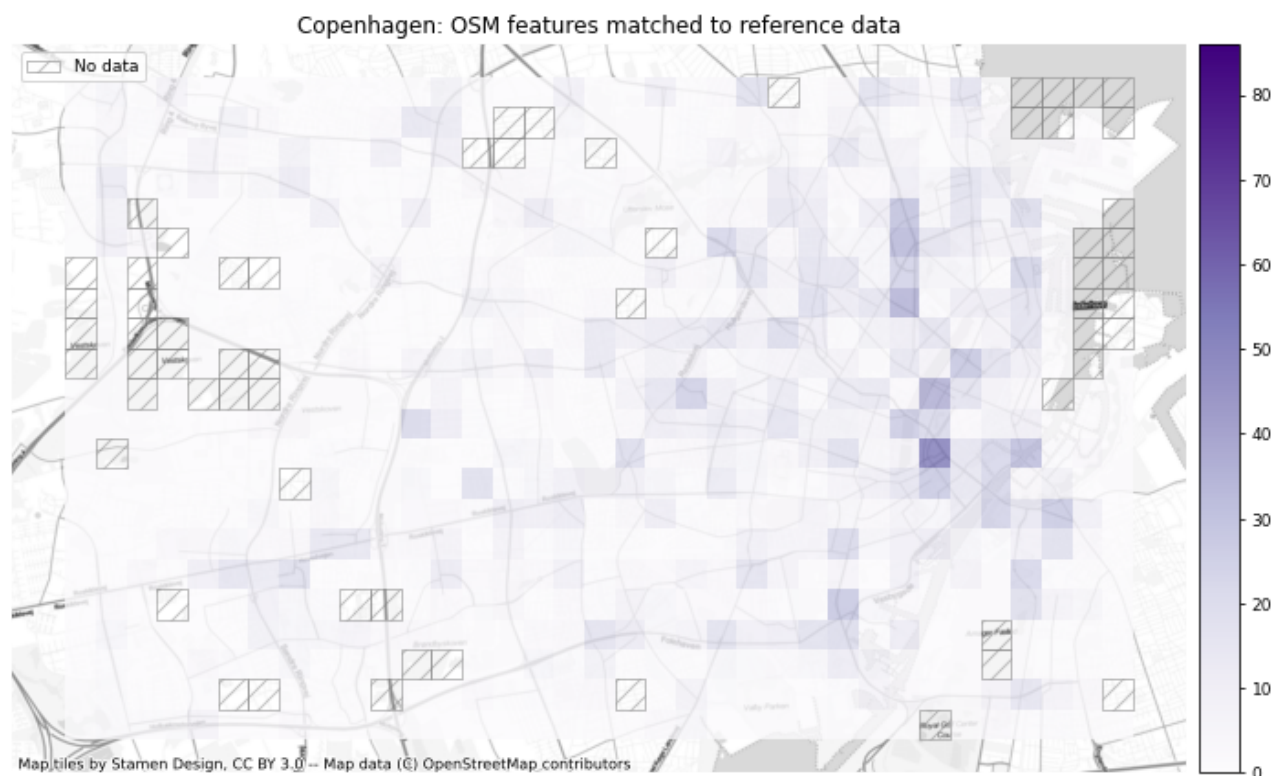

### Feature matching success

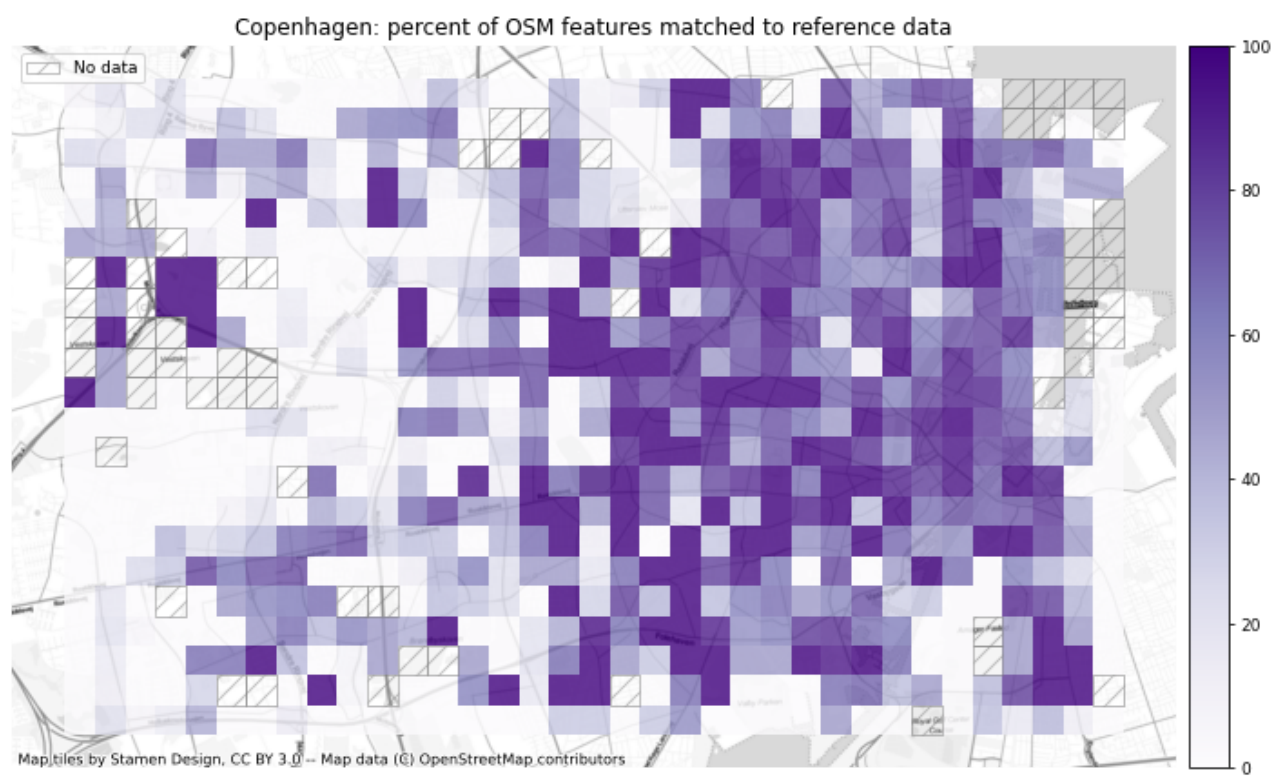

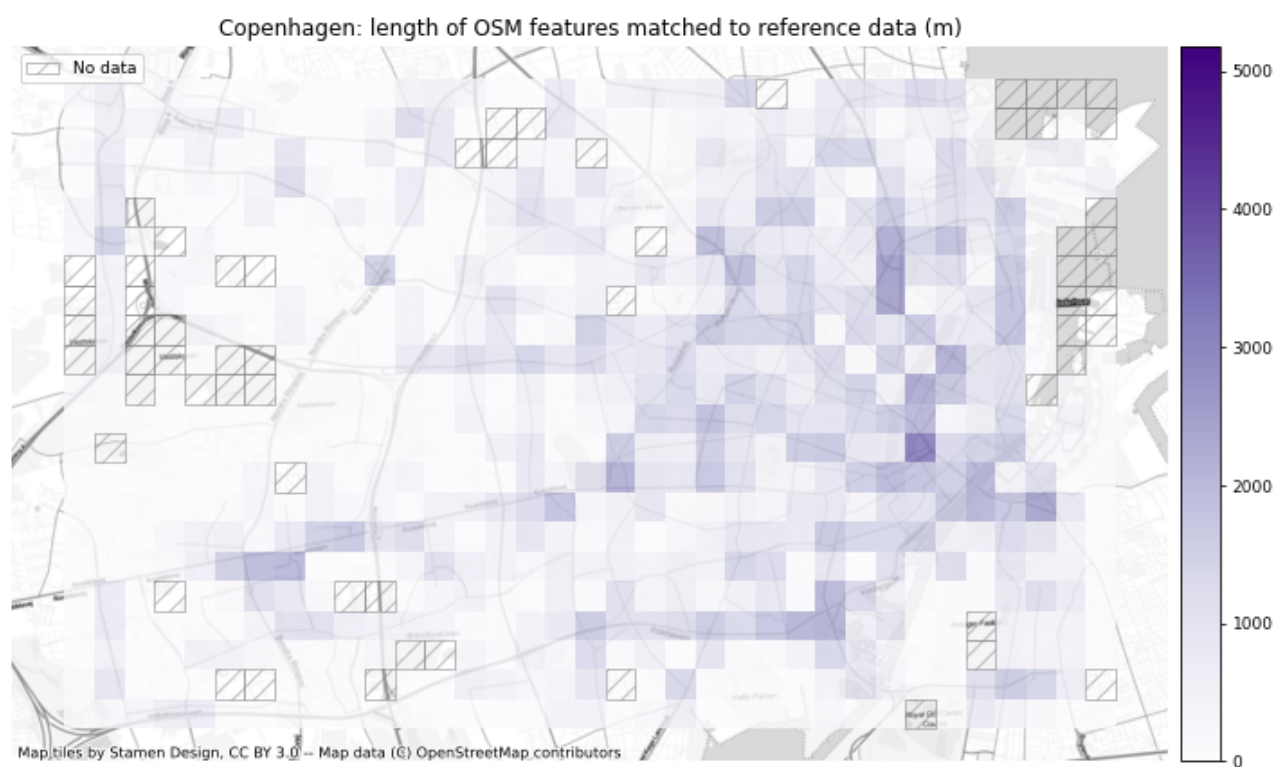

In the plots below, the count, percent, and length of matched and unmatched features in each data set are summarized.

**Warning**

The number of matched features in one data set in a grid cell does not necessarily reflect the number of matched features in the other data set, since an edge can be matched to a corresponding edge in another cell. Moreover, the local count refers to edges intersected with the grid cell. For example, a long bike lane crossing 3 cells will thus be counted as matched in 3 different cells. This does not change the relative distribution of matched/unmatched features, but it does entail that the overall summary of matched/unmatched features above uses a different total count of edges than the plots below.

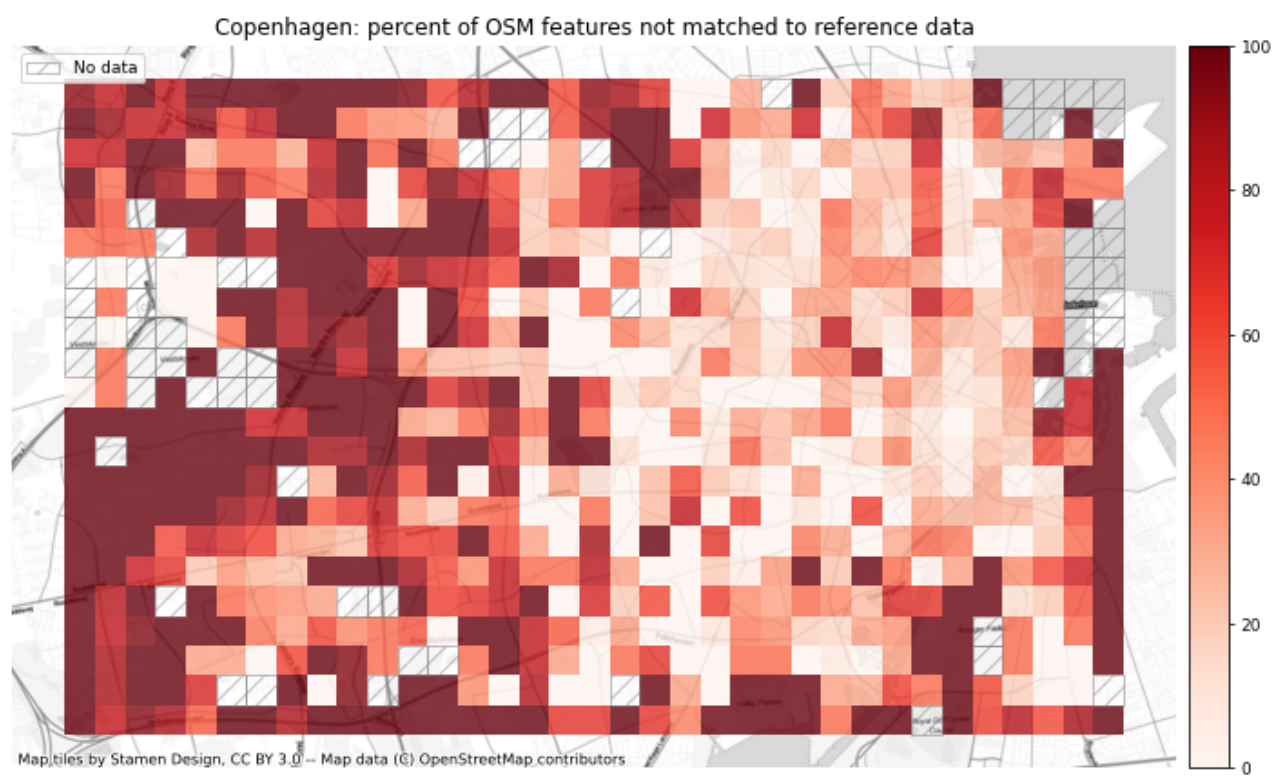

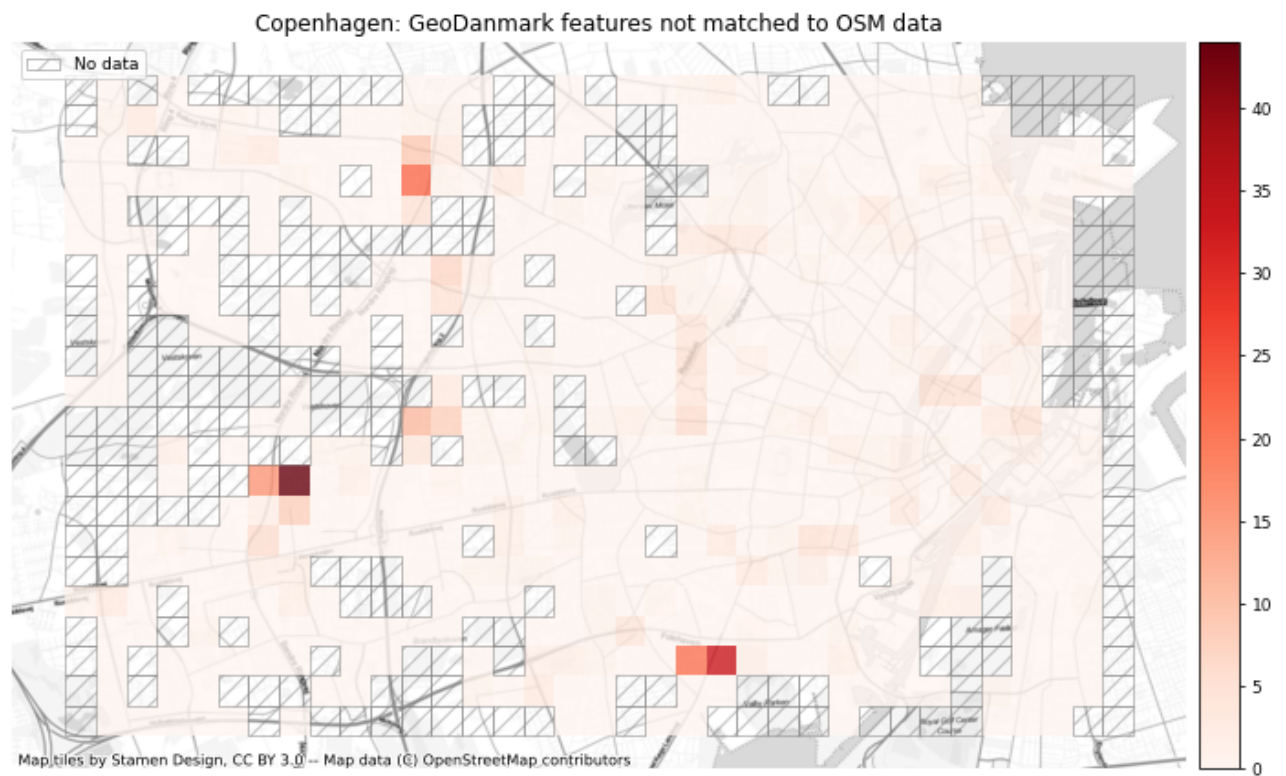

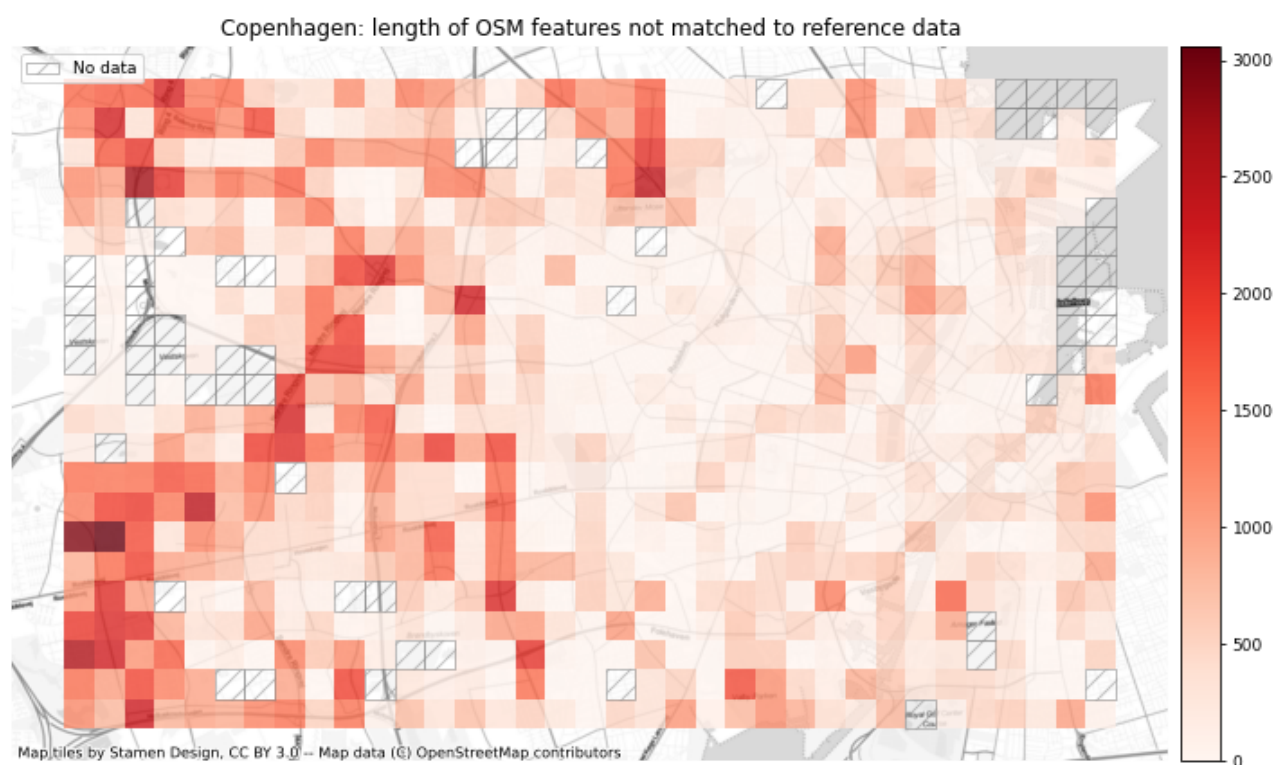

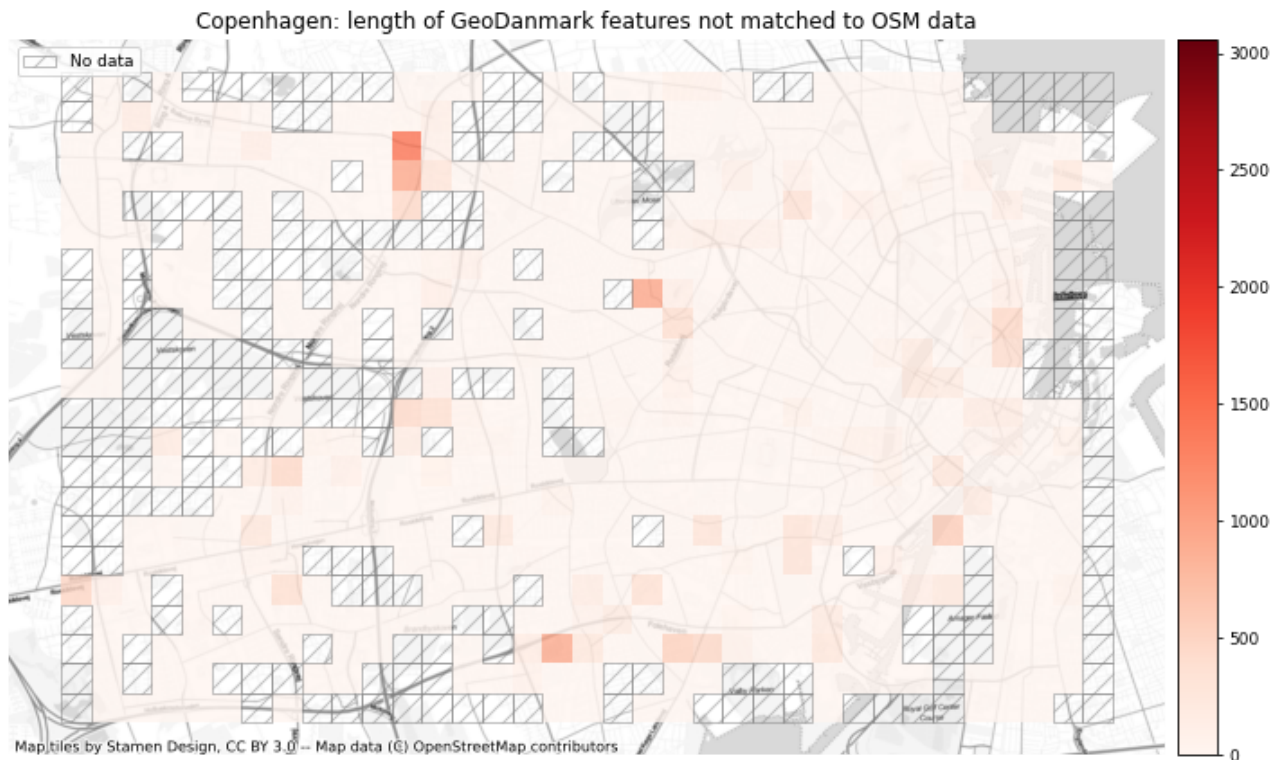

## Summary

### Feature Matching Results

	OSM	GeoDanmark
<b>Count of matched edges</b>	2,588	4,313
<b>Percent matched edges</b>	46%	92%
<b>Length of matched edges (km)</b>	423	603
<b>Percent of matched network length</b>	52	96
<b>Local min of % matched edges</b>	4%	12%
<b>Local max of % matched edges</b>	100%	100%
<b>Local average of % matched edges</b>	62%	95%
